The primary source for our capacity forecasts is our annual DDP asset report that presents the outcome of our capacity planning engineers' (at least) annual review of the pipeline hydraulic modelling. This report confirms the most up to date and accurate modelling representation of the physical pipeline system, and is used for capacity management, control room, expansion and works planning, day-to-day operation, maintenance and outage planning, and emergency management and survival time. This report's modelling is our reference for the current DDP pipeline capacities and linepack for the varying scenarios of summer and winter periods and operational compressor maintenance.

We then overlay known sales and contract terms, and forecast loads against these to identify the capacity available for sale.
